CHAPTER 1

INTRODUCTION

Chick-fil-A® is planning to construct a 4,978 square-foot fast-food restaurant with a drive-through at 2700 US-31 South. In addition, a 100-bed extended stay hotel is planned for the site. The proposed site is bordered on the north by the Williams Kia dealership and on the south by the Williams Honda dealership. On the west side of US-31 exists a Red Lobster restaurant and Discount Tire store. Figure 1 shows the location of the proposed site. Access to the proposed site will be via full access driveway to US-31.

The purpose of this traffic impact study was to analyze the potential impacts of the planned development and to identify what physical and/or operational roadway system improvements may be necessary to mitigate impacts created by this development's traffic. Tasks undertaken to complete the analyses include:

1. **Data Collection.** Applicable information regarding the existing operating conditions of the adjacent roadways was obtained from the Michigan Department of Transportation (MDOT). Data was taken from Gridsmart cameras installed at adjacent intersections that provided 24-hour turning movement count data from July 2020. Weekday morning, weekday afternoon, and Saturday midday peak hour volumes along US 31 at the proposed site were determined from the provided data. Information regarding lane configurations, speed limits, traffic controls, and other related data for the study area roadways was also collected.
2. **Background Growth.** Per input from Garfield Township and the Michigan Department of Transportation (MDOT) staff, an annual background traffic growth rate of 0.75 percent was applied to 2020 traffic count data to reflect anticipated non-development traffic increases from 2020 to the 2022 and 2032 horizon years.

Figure 1. Location Map and Study Area

3. **Trip Generation/Distribution.** The number of trips the proposed development is expected to generate during peak hours was identified. These trips were then assigned to the adjacent street system based upon the patterns followed by existing traffic.
4. **Levels of Service.** Capacity calculations were completed at the site access point to identify anticipated future peak hour operational characteristics.
5. **Mitigation.** Roadway/intersection improvements were identified, when applicable, that will enable the adjacent roadways and study area intersections to maintain equal and/or acceptable levels of operation under future conditions upon the addition of background traffic growth and/or due to development traffic.

Pre-study coordination was completed with Garfield Township and MDOT staff to help identify the required study area, study parameters, and any specific areas of concern. The following chapters outline the results of analyses completed during the study process.

CHAPTER 2

EXISTING CONDITIONS

The first step in the identification of potential traffic impacts is to determine how well the adjacent streets are operating under current conditions. This chapter summarizes the data collection and existing operating conditions analysis procedures.

Key Study Area Roadways

US Highway 31

US-31 is a major north-south arterial roadway within the study area under MDOT operational jurisdiction. Within the study area, it generally has a five-lane cross section with a speed limit of 45 miles per hour. Weekday 24-hour traffic volumes along US-31 vary significantly by season, but has an annual average daily traffic (AADT) of approximately 28,000 vehicles per day.

Northbound view of US-31 approaching the site

Data Collection

Existing traffic volumes along US 31 at the proposed site were collected in July 2020. The turning-movement counts were taken from Gridsmart cameras installed at adjacent intersections that provided 24-hour turning movement count data. From that data, morning, evening, and Saturday peak hours were determined. Based on discussion with MDOT, the adjustment for COVID-19 impacts on traffic would facilitate increasing field counts from 1-6 percent. For this study, a 6 percent increase was added to the counts to adjust for the COVID-19 impacts on traffic. As the volumes along US-31 vary significantly by season, these data were factored down by 31 percent for the weekday morning and afternoon counts and 28 percent for the Saturday count, based on MDOT seasonal factor adjustments. Detailed printouts of the count reports are included in the appendix.

These counts indicated that the typical weekday peak hours generally occur between 8:00 a.m. to 9:00 a.m. and 4:00 p.m. to 5:00 p.m. The Saturday midday peak hour occurred between 12:15 p.m. to 1:15 p.m.

Existing Conditions Capacity Analysis

An existing conditions capacity analysis was not completed as the site currently includes only one single family home which would generate a minimal number of trips.

CHAPTER 3

FUTURE (2022) CONDITIONS

The purpose of this chapter is to summarize the anticipated future (2022) traffic conditions within the study area with the proposed development traffic in place. These analyses provide the before/after comparison of future conditions and helps define the timing and applicability of any potential 2022 roadway improvements necessary to mitigate the impact of the proposed development.

Proposed Development and Site Access

Chick-fil-A® is planning to construct a 4,978 square-foot fast-food restaurant with a drive-through at 2700 US-31 South. In addition, a 100-bed extended stay hotel is planned for the site. Access to the proposed site will be via full access driveway to US-31. A copy of the proposed site plan is included in the appendix.

Background Traffic Growth

Based on discussions with the Township and MDOT, the existing adjusted peak hour volumes within the study area were increased by 0.75 percent per year. As the counts were taken in 2020 and a one-year completion would occur in 2022, the 0.75 percent increase was applied over two years to represent background traffic growth.

Trip Generation

Trip Generation, Tenth Edition, by the Institute of Transportation Engineers (ITE) and previously collected trip generation data at an existing Chick-fil-A® site were used to calculate the anticipated traffic that may be generated by the proposed site. Trips were calculated for the typical weekday morning, weekday afternoon, and Saturday midday peak hours. Table 1 shows a comparison between the ITE trip generation calculation results and the data collected at the existing Chick-fil-A® site. The Chick-fil-A® trip generation data was collected in 2017 at a similar site located in South Bend, IN. The driveway counts and an aerial of the South Bend site are included in the appendix.

Table 1. Chick-fil-A® Peak Hour Trip Generation Comparison

Source	Size	AM		PM		SAT	
		Enter	Exit	Enter	Exit	Enter	Exit
South Bend, IN Chick-fil-A® ¹	5,000 sq. ft.	48	51	135	129	169	151
Fast-Food Restaurant with Drive-through ²	4,978 sq. ft.	102	98	85	78	139	134
Trip Differential:		-54	-47	50	51	30	17

1. Chick-fil-A® Traffic Impact Study (CFA #3844), 2017

2. ITE Trip Generation Manual, 10th Edition, Land Use Code 934

As shown in Table 1, the South Bend Chick-fil-A® site generated significantly less trips during the weekday morning peak hour while generating significantly more during the weekday afternoon peak hour. There was a less significant trip differential during the Saturday midday peak hour. The greater of the ITE and the Chick-fil-A® trip generation rate was utilized for the future conditions analyses as it represents a conservative estimate as to the number of trips the proposed Chick-fil-A® will generate. Table 2 shows the weekday morning, weekday afternoon, and Saturday midday peak hour trips anticipated to be generated by the site, including adjustments for pass-by trips.

The ITE *Trip Generation Manual* was utilized to determine the trip generation for the proposed 100-bed extended stay hotel on the site. Information provided outlined 100 beds, which was analyzed as 100 rooms for the most conservative estimate. The trip generation data is also displayed in Table 2.

Table 2. Projected Weekday Morning and Afternoon Peak Hour Trip Generation

Land Use	Size	AM		PM		SAT	
		Enter	Exit	Enter	Exit	Enter	Exit
Fast-food Restaurant with Drive-through	4,978 sq. ft.	102	98	135	129	169	151
Hotel ¹	100 beds	27	18	25	24	41	32
Total Trips		129	116	160	153	210	183

	Total new trips:	79	68	92	89	125	108

1. ITE Trip Generation Manual, 10th Edition, Land Use Code 310

2. ITE pass-by reduction percentages applied to commercial uses: Fast-food Restaurant (49% AM peak, 50% PM peak)

3. 50% pass-by reduction assumed for Saturday midday peak-hour

Source: Chick-fil-A® Traffic Impact Study (CFA #3844), 2017 and ITE *Trip Generation Manual*, 10th Edition

Trip Distribution

The directional distribution of the project-generated new trips was based upon existing travel patterns and engineering judgment. The approximate directional distribution to/from the proposed development for site-generated new trips is anticipated to be as follows:

Direction	AM Peak	PM Peak	Saturday Peak
To/from US-31 north	35%	55%	45%
To/from US-31 south	65%	45%	55%

Based upon the above distribution patterns for new trips, existing directional patterns along US-31 for pass-by trips, and the current site plan layout, the anticipated peak hour site-generated traffic was assigned to the proposed access driveway. Figure 2 shows the total anticipated morning, afternoon, and Saturday peak hour trips for site-generated traffic upon full completion and occupancy of the proposed site.

The anticipated site trips were added to the background (2022) peak hour volumes to depict the estimated total future (2022) volumes during the weekday morning, weekday afternoon, and Saturday midday peak hours. Figure 3 shows the total anticipated future (2022) volumes.

Future (2022) Capacity Analysis

Intersection "level-of-service" (LOS) calculations were completed to evaluate the future (2022) peak hour conditions at the proposed driveway. These calculations were completed using techniques outlined in the *Highway Capacity Manual*, published by the Transportation Research Board. Per Township and MDOT requirements, *Synchro*® traffic analysis software, version 10, based on the *Highway Capacity Manual* methodologies, was used in the analysis.

Levels-of-service at signalized and unsignalized intersections relates to the delay, traffic volumes, and intersection geometry. Levels-of-service (LoS) are expressed in a range from "A" to "F", with "A" denoting the highest, or best, operating conditions. Generally, a LoS "D" rating is considered the minimum acceptable service level for signalized and unsignalized intersections in most areas, although an LoS "E" or "F" can be deemed as acceptable at times in urban areas, during the peak hours, or for low-volume movements. The criteria for determining the LoS at signalized and unsignalized intersections are outlined in the appendix of this report.

Results of the level-of-service analyses are shown in Table 3 and in Figure 3. As shown, all movements are anticipated to operate at LoS "D" or better during the weekday morning, weekday afternoon, and Saturday midday peak hours except for some of the left-turn movements. Copies of the *Synchro*® analyses for the future (2022) conditions are included in the appendix.

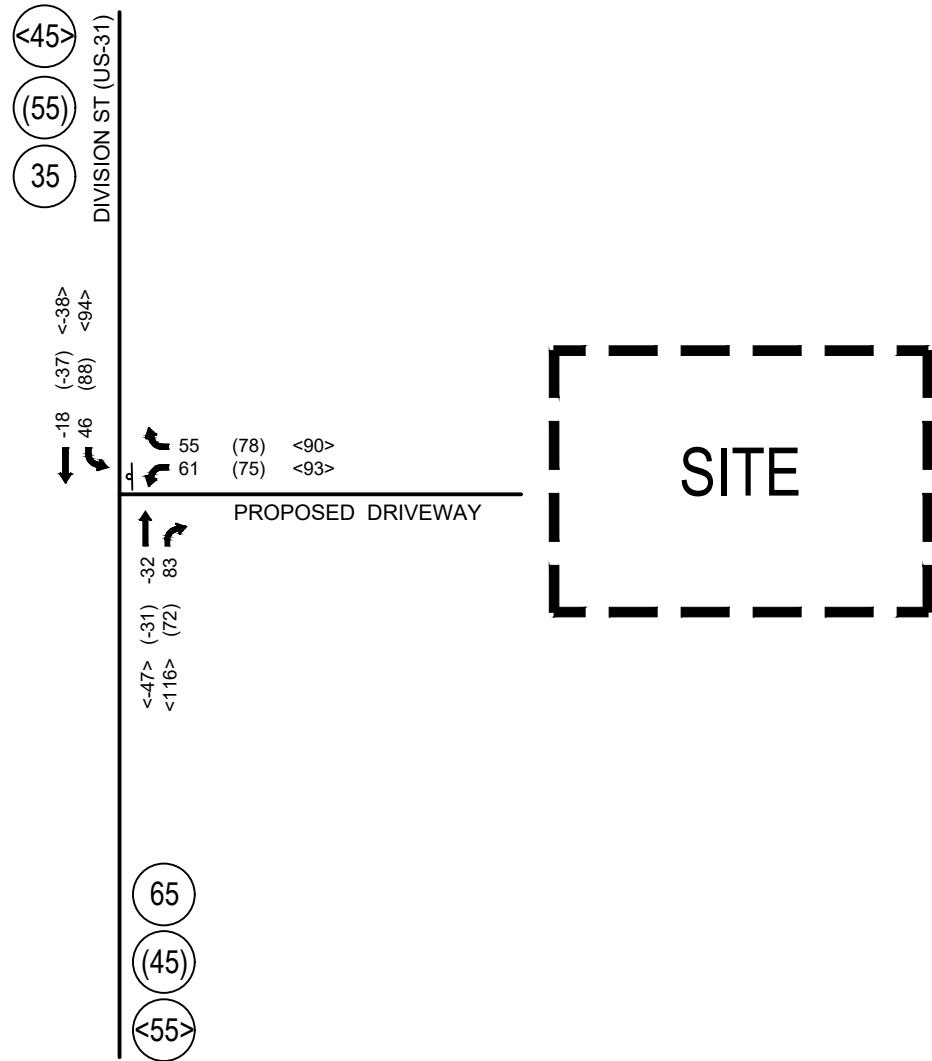

The stop-controlled westbound left-turn movement at the US-31/access driveway intersection is anticipated to operate at LoS "E" during the weekday afternoon with an anticipated 95th percentile queue of approximately 2 vehicles. The Saturday midday peak hour is anticipated to operate at LoS "F" with an anticipated 95th percentile queue of approximately 4 vehicles. These levels-of-service would be considered acceptable as the 95th percentile queue is anticipated to be short. In addition, these level-of-service values can be expected along a high-volume major corridor during the peak hours, particularly for left-turn movements. Site traffic would also have the option of turning right to exit the site during these times.

While not considered as part of this analysis, the site owner is working with adjacent property owners to secure cross-access between this development, the Lowes site to the north, and the Grand Traverse Mall site to the southeast. This cross-access would provide customers with access to the existing traffic signal at the Lowes Driveway and the roadway network surrounding the mall site.

Table 3. Future (2022) Levels-of-Service and Delay

CHAPTER 4

FUTURE (2032) CONDITIONS

The purpose of this chapter is to summarize the anticipated future (2032) traffic conditions within the study area ten years after the completion of the proposed development.

Future (2032) Traffic Volumes

As with the future (2022) conditions, the existing adjusted peak hour volumes within the study area were increased by 0.75 percent annually to account for background traffic growth. As the analysis year is 2032 (twelve years), existing traffic volumes were increased by 9.4 percent.

The site generated trips discussed in the previous chapter were added to the background (2032) volumes to depict the estimated total future (2032) volumes during the weekday morning, weekday afternoon, and Saturday midday peak hours. Figure 4 shows the total anticipated future (2032) volumes.

Future (2032) Capacity Analysis

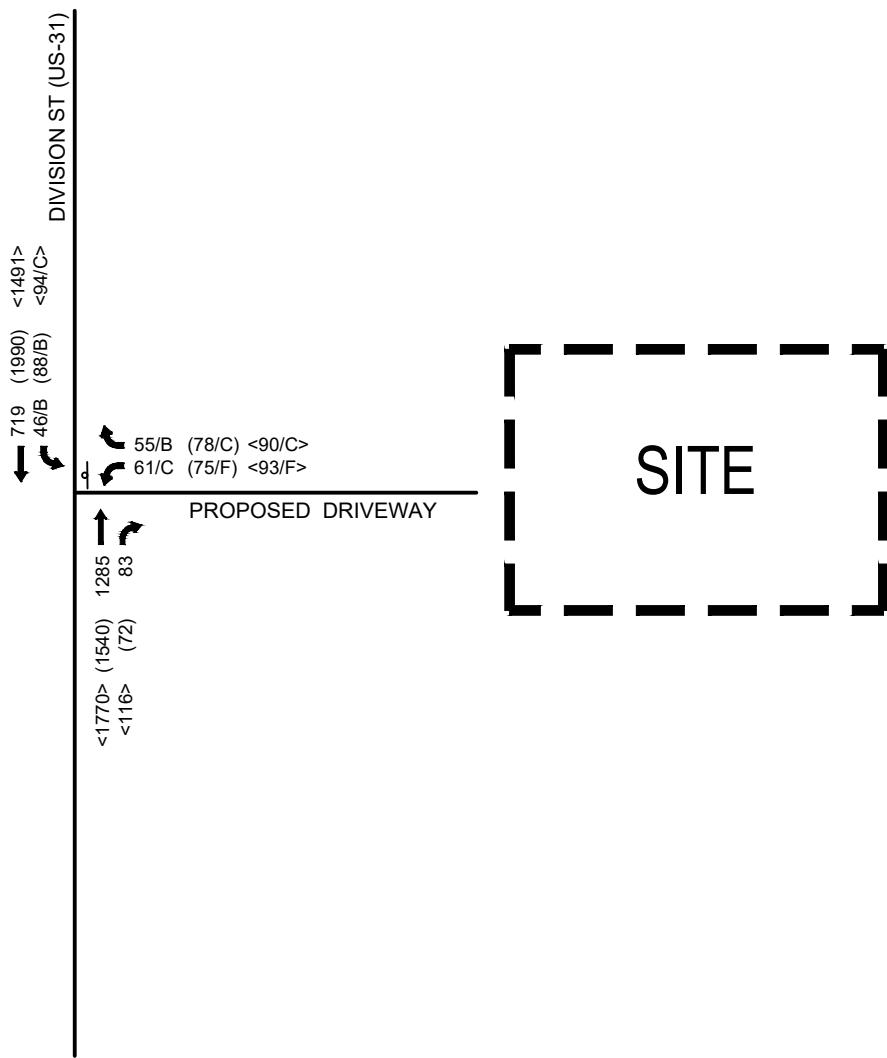

Intersection level-of-service calculations were completed to evaluate the future (2032) peak hour conditions at the proposed driveway. Results of the analyses are shown in Table 4 and in Figure 4. As shown, all movements are anticipated to operate at LoS "D" or better during the weekday morning, weekday afternoon, and Saturday midday peak hours except for the same westbound left-turn movement as the future (2022) conditions. Copies of the *Synchro*® analyses for the future (2032) conditions are included in the appendix.

Table 4. Future (2032) Levels-of-Service and Delay

Intersection/ Movement	Future (2022) Conditions						Future (2032) Conditions

SBT	A	0	A	0	A	0	A	0	A	0	A	0

Source: Progressive AE, March 2021

The results of the future (2032) capacity analysis show the proposed driveway is anticipated to operate in largely the same manner ten years after the completion of the Chick-fil-A® site compared to the future (2022) conditions. The westbound left-turn movement from the access drive is anticipated to decrease from LoS "E" in future (2022) conditions to LoS "F" in future (2032) conditions during the afternoon peak hour; however, it is projected to continue to operate at the same LoS "F" under the future (2032) conditions during the Saturday peak hour. This would be considered acceptable based on the same reasons outlined in the future (2022) conditions analyses.

CHAPTER 5

CONCLUSIONS AND RECOMMENDATIONS

The chapter summarizes the results of the analyses performed as part of the study. Recommendations to improve the surrounding roadway network are also presented.

Conclusions

Based on the analyses performed as part of this study, the development of the Chick-fil-A® site will have minor impacts to the surrounding roadway network. The findings of this study are as follows:

Future (2022) Conditions

The proposed Chick-fil-A® and 100-bed extended stay hotel project site is anticipated to generate approximately 245 (129 entering, 116 exiting) trips during the weekday morning peak hour, 313 (160 entering, 153 exiting) trips during the weekday afternoon peak hour, and 393 (210 entering, 183 exiting) during the Saturday midday peak hour. Approximately 50 percent of these trips would be classified as pass-by trips.

The stop-controlled westbound left-turn movement at the US-31/access driveway intersection is anticipated to operate at LoS "E" during the weekday afternoon with an anticipated 95th percentile queue of approximately 2 vehicles. The Saturday midday peak hour is anticipated to operate at LoS "F" with an anticipated 95th percentile queue of approximately 4 vehicles. These levels-of-service would be considered acceptable as the 95th percentile queue is anticipated to be short. In addition, these level-of-service values can be expected along a high-volume major corridor during the peak hours, particularly for left-turn movements. Site traffic would also have the option of turning right to exit the site during these times.

While not considered as part of this analysis, the site owner is working with adjacent property owners to secure cross-access between this development, the Lowes site to the north, and the Grand Traverse Mall site to the southeast. This cross-access would provide customers with access to the existing traffic signal at the Lowes Driveway and the roadway network surrounding the mall site.

Future (2032) Conditions

The results of the future (2032) capacity analysis show the proposed driveway is anticipated to operate in largely the same manner ten years after the completion of the Chick-fil-A® site compared to the future (2022) conditions. The westbound left-turn movement from the access drive is anticipated to decrease from LoS "E" in future (2022) conditions to LoS "F" in future (2032) conditions during the afternoon peak hour; however, it is projected to continue to operate at the same LoS "F" under the future (2032) conditions during the Saturday peak hour. This would be considered acceptable based on the same reasons outlined in the future (2022) conditions analyses.

Recommendations

Based on the results of the analyses performed, no improvements to the surrounding roadway network would be necessary to mitigate the impacts of future traffic anticipated to be generated by the proposed site.

Technical Appendix

Chick-fil-A (Traverse City) TIS

- **Level of Service Definitions**
- **Glossary**
- **Site Plan**
- **South Bend CFA Driveway Counts**
- **Traffic Count Data**
- **Synchro Analyses Results**

Level of Service Definitions

Signalized Intersections

- Level of Service A:** Describes operations with very low average stopped delay, i.e., less than 10.0 seconds per vehicle. This occurs when progression is extremely favorable, and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay.
- Level of Service B:** Describes operations with an average stopped delay in the range of 10.0 to 20.0 seconds per vehicle. This generally occurs with good progression and/or short cycle lengths. More vehicles stop than for LOS A, causing higher levels of average delay.
- Level of Service C:** Describes operations with an average stopped delay in the range of 20.1 to 35.0 seconds per vehicle. These higher delays may result from fair progression and/or longer cycle lengths. Individual cycle failures may begin to appear in this level. The number of vehicles stopping is significant at this level, although many still pass through the intersection without stopping.
- Level of Service D:** Describes operations with an average stopped delay in the range of 35.1 to 55.0 seconds per vehicle. At Level of Service D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high v/c (volume/capacity) ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.
- Level of Service E:** Describes operations with an average stopped delay in the range of 55.1 to 80.0 seconds per vehicle. This is considered to be the limit of acceptable delay in many cases. These high delay values generally indicate poor progression, long cycle lengths, and high v/c ratios. Individual cycle failures are a frequent occurrence.
- Level of Service F:** Describes operations with an average stopped delay in excess of 80.0 seconds per vehicle. This is considered to be unacceptable to most drivers. This condition often occurs with over-saturation, i.e., when arrival flow rates exceed the capacity of the intersection. It may also occur at high v/c ratios with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing causes to such delay levels.

Level of Service Definitions

Unsignalized Intersections

- Level of Service A:** Average delay per vehicles for impeded movements is less than 10 seconds. There is little or no delay with typically low side street and/or main street traffic.
- Level of Service B:** Average stopped delays from 10.1 seconds to 15.0 seconds. Short delays, many acceptable gaps in main street traffic stream.
- Level of Service C:** Average delay per vehicle ranges from 15.1 to 25.0 seconds. Average traffic delays with frequent gaps in main street traffic.
- Level of Service D:** Average delays from 25.1 to 35.0 seconds for impeded movements. Long traffic delays for impeded movements due in part to a limited number of acceptable gaps.
- Level of Service E:** Average delays in the 35.1 to 50.0 second range. May experience very long delays for impeded movements with a very small number of acceptable gaps in the traffic stream.
- Level of Service F:** Average vehicle delays of over 50.0 seconds. Extreme traffic delays with virtually no acceptable gaps in main street traffic.

Glossary

Approach: A set of lanes accommodating all left-turn, through, and right-turn movements arriving at an intersection from a given direction.

Arterial: Signalized streets that serve primarily through traffic and provide access to abutting properties as a secondary function.

Average Stopped Delay: The total time vehicles are stopped in an intersection approach or lane group during a specified time interval divided by the volume departing from the approach or lane group during the same time period, in seconds per vehicle.

Background Traffic: Traffic volumes that will be on the roadway network without the presence of the proposed development.

Bypass Lane: A one-lane widening on a two-lane roadway that allows through traffic to pass by waiting left-turn traffic.

Capacity: The maximum rate of flow at which persons or vehicles can be reasonably expected to traverse a point or uniform segment of a lane or roadway during a specified time period under prevailing roadway, traffic, and control conditions; usually expressed as vehicles per hour or persons per hour.

Conflicting Traffic Volume: The volume of traffic which conflicts with a specific movement at an intersection.

Corridor: A lineal study area aligned with a roadway facility in which traffic, land use, right-of-way, environmental, and other factors are evaluated to determine future transportation facility needs.

Cycle: Any complete sequence of traffic signal indications.

Cycle Length: The total time for a traffic signal to complete one cycle.

Design Hour Volume: The traffic volume for the design hour, usually a forecast of the relevant peak hour volume, in vehicles per hour.

Diverted Linked Trips: Trips from the traffic volume on roadways within the vicinity of the generator but which requires a diversion from that roadway to another roadway to gain access to the site.

Driveway Offset: Distance between driveways on opposite sides of a roadway, measured parallel to roadway.

Freeway: A multi-lane divided highway having a minimum of two lanes for exclusive use of traffic in each direction and full control of access and egress.

Gaps (Critical Gap): The median time headway between vehicles in a major traffic stream which will permit side-street vehicles to cross through or merge with the major traffic stream.

Green Time: The actual length of the "green" indication for a given movement at a signalized intersection.

Level of Service: A qualitative measure describing operational conditions within a traffic stream; generally described in terms of such factors as speed and travel time, delay, freedom to maneuver, traffic interruptions, comfort and convenience, and safety.

Operational Analysis: A use of capacity analysis to determine the prevailing level of service on an existing or projected facility, with known or projected traffic, roadway, and control conditions. This analysis can involve a particular location, such as an intersection or a corridor.

Pass-by Trips: Trips made as intermediate stops on the way from an origin to a primary trip destination.

Peak Hour (AM): The one hour period in the morning representing the highest hourly volume of traffic flow on the adjacent public street system.

Peak Hour (PM): The one hour period in the afternoon or evening representing the highest hourly volume of traffic flow on the adjacent public street system.

Peak Hour Factor: The hourly volume during the maximum volume hour of the day divided by four times the peak 15-minute flow within the peak hour; a measure of traffic demand fluctuation within the peak hour.

Phase: The part of the signal cycle allocated to any combination of traffic movements receiving the right-of-way simultaneously during one or more intervals.

Roadway Conditions: Geometric characteristics of a street or highway, including the type of facility, number and width of lanes (by direction), shoulder widths and lateral clearances, design speed, etc.

Service Drive: A roadway (usually private) that provides internal access to two or more uses.

Site Traffic: Existing or projected vehicular traffic generated by the development.

Study Area: The geographic area containing site access points and critical intersections (and connecting highway segments) which are impacted by the site-traffic generated by the development, and should be evaluated.

System Improvements: Added lanes, signal improvements, and other roadway improvements not considered site-related improvements.

Traffic Impact: The adverse impact on intersection Level of Service and/or street and highway safety and operations as determined by the criteria and procedures set forth in this handbook.

Trip (Directional Trip): A single or one-direction vehicle movement with either the origin or the destination (exiting or entering) inside a study site.

Trip Distribution: The distribution or assignment of site traffic into site driveways and study area roadways/intersections based upon expected direction of approach and departure.

Unsignalized Intersection: Any intersection not controlled by traffic signals.

Volume: The number of persons or vehicles passing a point on a lane or roadway during some time interval, such as one hour or during an average day.

Volume-to-Capacity Ratio (V/C): The ratio of demand flow rate to capacity for a traffic facility.
